OPPORTUNITIES

Opportunity	Estimated Savings
▲ Minify JavaScript	1.05 s ∧

Minifying JavaScript files can reduce payload sizes and script parse time. Learn more. [FCP] [LCP]

If your build system minifies JS files automatically, ensure that you are deploying the production build of your application. You can check this with the React developer tools extension. Learn more.

DIAGNOSTICS

🔺 Registers an `unload` listener   ⌃

The `unload` event does not fire reliably and listening for it can prevent browser optimisations like the back-forward cache. Use `pagehide` or `visibilitychange` events instead. Learn more

Properly size images   ⌃

Serve images that are appropriately-sized to save mobile data and improve load time. [Learn more](#).

Defer off-screen images   ⌃

Consider lazy loading offscreen and hidden images after all critical resources have finished loading to lower time to interactive. [Learn more](#).

Minify CSS   ⌃

Minifying CSS files can reduce network payload sizes. [Learn more](#). `FCP` `LCP`

If your build system minifies CSS files automatically, ensure that you are deploying the production build of your application. You can check this with the React developer tools extension. [Learn more](#).

Reduce unused CSS   ⌃

Reduce unused rules from stylesheets and defer CSS not used for above-the-fold content to decrease bytes consumed by network activity. [Learn more](#). `FCP` `LCP`

Reduce unused JavaScript   ⌃

Reduce unused JavaScript and defer loading scripts until they are required to decrease bytes consumed by network activity. [Learn more](#). `LCP`

If you are not server-side rendering, [split your JavaScript bundles](#) with `React.lazy()`. Otherwise, code-split using a third-party library such as [loadable-components](#).

Efficiently encode images   ⌃

Optimised images load faster and consume less mobile data. [Learn more](#).

Enable text compression   ⌃

Text-based resources should be served with compression (gzip, deflate or brotli) to minimise total network bytes. [Learn more](#). `FCP` `LCP`

Pre-connect to required origins   ⌃

Consider adding `preconnect` or `dns-prefetch` resource hints to establish early connections to important third-party origins. [Learn more](#). `FCP` `LCP`

Initial server response time was short   — Root document took 0 ms   ⌃

Keep the server response time for the main document short because all other requests depend on it. Learn more. [FCP] [LCP]

⚛   If you are server-side rendering any React components, consider using `renderToNodeStream()` or `renderToStaticNodeStream()` to allow the client to receive and hydrate different parts of the markup instead of all at once. Learn more.

Avoid multiple page redirects   ⌃

Redirects introduce additional delays before the page can be loaded. Learn more. [FCP] [LCP]

⚛   If you are using React Router, minimise usage of the `<Redirect>` component for route navigations.

○ **Pre-load key requests**   ⌃

Consider using `<link rel=preload>` to prioritise fetching resources that are currently requested later in page load. Learn more. [FCP] [LCP]

Use HTTP/2   ⌃

HTTP/2 offers many benefits over HTTP/1.1, including binary headers and multiplexing. Learn more.

Use video formats for animated content   ⌃

Large GIFs are inefficient for delivering animated content. Consider using MPEG4/WebM videos for animations and PNG/WebP for static images instead of GIF to save network bytes. Learn more [LCP]

Remove duplicate modules in JavaScript bundles   ⌃

Remove large, duplicate JavaScript modules from bundles to reduce unnecessary bytes consumed by network activity. [TBT]

Avoid serving legacy JavaScript to modern browsers   — Potential savings of 0 KiB   ⌃

Polyfills and transforms enable legacy browsers to use new JavaScript features. However, many aren't necessary for modern browsers. For your bundled JavaScript, adopt a modern script deployment strategy using module/nomodule feature detection to reduce the amount of code delivered to modern browsers, while retaining support for legacy browsers. Avoids an excessive DOM size — 49 elements ⌃

A large DOM will increase memory usage, cause longer style calculations and produce costly layout reflows. Learn more. TBT

Consider using a 'windowing' library, like `react-window`, to minimise the number of DOM nodes created if you are rendering many repeated elements on the page. Learn more. Also, minimise unnecessary re-renders using `shouldComponentUpdate`, `PureComponent` or `React.memo` and skip effects only until certain dependencies have changed if you are using the `Effect` hook to improve runtime performance.
